Clinical internship points between competency based learning students and conventional based students

Prawesty Diah Utami
Assessment of the Medical Education Unit, Faculty of Medicine, Hang Tuah University, II. Gadung No. 1 Surabaya

The Faculty of Medicine, Hang Tuah University had changed curriculum from conventional based method (teacher centered) to competency based learning method (student centered) since 1996. The first group of competency based learning method has entered internship.

Objective: to evaluate the values of internship between competency based learning students and conventional based students in 4 departement (interna, children health, neurology and psychiatry)

Methods: observe the score of examination test in 4 department (interna, children health, neurology and psychiatry) from first group of competency based learning and one group of conventional method who did internship.

Results: graduation rate, the first group of competency based learning had 0.82 (interna), 0.93 (children health), 0.98 (neurology) and 0.97 (psychiatry) which higher more than the graduation rate of conventional method had 0.74 (interna), 0.80 (children health), 0.95 (neurology) and 0.82 (psychiatry)

Conclusion: from observation there is difference between 2 methods which group of competency based learning had graduation rate in 4 department more higher than conventional based learning. Based from observation, exploration between internship score of 2 methods has to be done.
